

1. VPS

A VPS (Virtual Private Server) is a virtual computer in the cloud. You can install Ubuntu, Node.js, Flutter Web, MySQL, Docker, Nginx, Redis and GitHub Runner.

2. One VPS = One Server

A single VPS is a single server. It does not automatically become Server1, Server2 and Server3.

3. Scaling

To add more servers you create additional VPS instances. A Load Balancer distributes traffic among existing servers; it does not create new servers.

4. Hetzner Series

CX: Shared vCPU, lowest cost, good for learning and small projects.

CPX: Faster shared CPU generation, better for production apps.

CCX: Dedicated vCPU, enterprise and high performance workloads.

5. Example Plans

CX23: 2 vCPU, 4 GB RAM, 40 GB SSD.

CPX22: 2 vCPU, 4 GB RAM, 80 GB SSD.

CCX13: 2 Dedicated vCPU, 8 GB RAM, 80 GB SSD.

6. Upgrade

You can generally upgrade from CX to CPX or CCX. Projects, OS and databases usually remain, though a restart may occur. Always keep backups.

7. Approximate Capacity

CX23: ~50-150 active CRUD users.

CPX22: ~200-500 active CRUD users.

CCX13: ~500-1500 active CRUD users.

Actual capacity depends on your application, database queries and optimization.

8. Recommended Growth Path

Start: CX23

Growing: CPX22

Business: CCX13

Large scale: Multiple CCX servers + Load Balancer + Separate Database + Backups
